

Introduction

The LMB V10 module is used as the LMB interconnect for Xilinx® FPGA-based embedded processor systems. The LMB is a fast, local bus for connecting the MicroBlaze™ processor instruction and data ports to high-speed peripherals, primarily on-chip block RAM (BRAM).

Features

- Efficient, single master bus (requires no arbiter)
- Separate read and write data buses
- Low FPGA resource utilization

Functional Description

A MicroBlaze processor system using two LMB V10 modules is shown in [Figure 1](#). This system illustrates the use of both I and D side LMB buses connecting to a dual-ported BRAM Block via separate LMB BRAM interface controllers.

Design Implementation

Design Tools

The LMB V10 module design is hand written.

The NGC netlist output from XST is then input to the Xilinx Alliance tool suite for actual device implementation.

Target Technology

The target technology is an FPGA listed in the [Supported Device Family](#) field of the LogiCORE Facts table.

Support

Xilinx provides technical support for this LogiCORE product when used as described in the product documentation. Xilinx cannot guarantee timing, functionality, or support of product if implemented in devices that are not defined in the documentation, if customized beyond that allowed in the product documentation, or if changes are made to any section of the design labeled *DO NOT MODIFY*.
